

Nonsurgical Pain Management: Options for Refractory Osteoarthritis or Painful Total Joint Arthroplasty

Peter I-Kung Wu, MD, PhD Assistant Professor Non-Operative Spine Physical Medicine and Rehabilitation Department of Orthopaedic Surgery UCSF Arthroplasty for the Modern Surgeon: Hip, Knee and Health Innovation Technology

September 29, 2023

No Disclosures

Objectives

- Guidelines for nonsurgical management of knee osteoarthritis
- Therapeutic agents in nonsurgical interventions
- Ultrasound-guided injections
- Genicular nerve denervation
- Peripheral nerve stimulation
- Genicular artery embolization

Guidelines

AAOS Clinical Practice Guideline Summary: Management of Osteoarthritis of the Knee (Nonarthroplasty), Third Edition

🐵 Brophy, Robert H. MD; Fillingham, Yale A. MD

Recommend / Benefit>Harm | Not Recommend / Harm>Benefit | Unclear / Requires additional evidence

Strength of Recommendations for Non-Operative Therapies Strong – ≥2 "High" quality studies Moderate – ≥2 "Moderate" quality Limited – ≥1 "Low" quality studies **Consensus** – no evidence, or OR 1 "High" quality study; no or OR 1 "Moderate" quality study; higher quality evidence downgraded minor concerns in the evidence-todue to major concerns; clinical major concerns decision (EtD) framework opinion of guideline group Lateral wedge insoles Cane **Dietary supplements** Needling **Topical NSAIDs** Braces Manual therapy Free-floating interpositional devices Exercises (PT, aquatic) Neuromuscular training (balance, Massage agility, coordination) Weight loss intervention Laser therapy Patient education programs Self Management Intra-articular corticosteroids (short-Acupuncture term relief) **Oral NSAIDs** Hyaluronic acid intra-articular **Transcutaneous Electric Nerve Stim** injection (routine use) Pulsed Elec, Nerve Stimulation Oral acetaminophen Arthroscopy with lavage and/or Pulsed EM Field Therapy debridement **Oral opioids** Arthroscopic partial meniscectomy Extracorporeal shockwave therapy Platelet Rich Plasma **Denervation therapy** High tibial osteotomy

OSTEDARTHRITIS

Alison J. Gibbs # \$ + + 1, Bimbi Gray ± 8, Jason A. Wallis \$ ++ ±+, Nicholas F. Taylor \$ 88, Joanne L. Kemp # \$, David J. Hunter ± 8 2, Christian J. Barton # \$

Recommendations:

- For:
 - exercise
 - education
 - weight management
 - walking aids
 - NSAIDs
 - intra-articular steroid injections
- Against:
 - dietary supplements (glucosamine, chondroitin, fish oil/ omega-3, vitamin D)
 - opioids
 - stem cell injections
- Inconsistent:
 - Tylenol
 - hyaluronic acid
 - PRP
 - adjunctive treatments

Therapeutic Agents

Therapeutic Agents						
	Description	Effects				
Corticosteroids	 derivatives of prednisolone – analog of cortisol, a glucocorticoid class of steroid hormones that control metabolism and inflammation Triamcinolone acetonide and methylprednisolone acetate common 	- provide anti-inflammatory effects				
Hyaluronic Acid	 high molecular-weight glycosaminoglycan present in cartilage and synovial fluid (normal: 5000–6000 kDa, <u>linear chain</u> structure) lubricant and regulator of cellular activities in joints Synvisc (Hylan g-f 20), 6000 kDa, most studied Euflexxa, 2400-3600 kDa most similar to healthy HA wrt molecular structure and rheological property 	- facilitate maintenance of joint lubrication - provide anti-inflammatory, analgesic, and chondroprotective effects: downregulate pro-inflammatory factors, such as PGE2 and NFkB, and proteases and proteinases that break down joint matrix				
Platelet-Rich Plasma	 supraphysiologic platelet concentrations compared to whole blood, at least 5x, or 1 x 10⁶/µL Leukocyte content may increase risk of local adverse reactions, swelling and pain 	 promote healing and anti-inflammation provide longer-term relief

Ultrasound Guided Injections

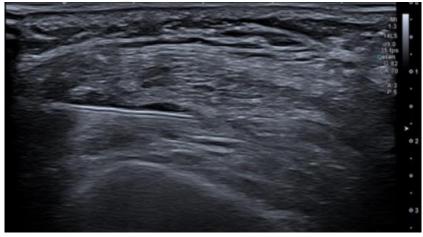

- Percutaneous musculoskeletal intervention serves to evaluate and manage knee pain
- Ultrasound guided procedures offer many advantages
 - Greater accuracy
 - Real-time visualization
 - Lack of ionizing radiation
 - Portability
 - Low cost

Genicular Nerve Denervation

AMERICAN JOURNAL OF Physical Medicine & Rehabilitation

LITERATURE REVIEW

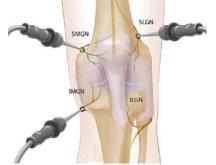

The Effectiveness of Fluoroscopically Guided Genicular Nerve Radiofrequency Ablation for the Treatment of Chronic Knee Pain Due to Osteoarthritis A Systematic Review

Fogarty, Alexandra E. MD; Burnham, Taylor DO; Kuo, Keith BS; Tate, Quinn MD; Sperry, Beau P. BA; Cheney, Cole MD; Walega, David R. MD, MSCI; Kohan, Lynn MD; Cohen, Steven P. MD; Cushman, Daniel M. MD; McCormick, Zachary L. MD; Conger, Aaron DO

 moderate-quality evidence notes fluoroscopically guided genicular nerve RFA is effective for reducing pain from knee OA (≥50%) at a minimum of 6-9 months (49-74% success rate)

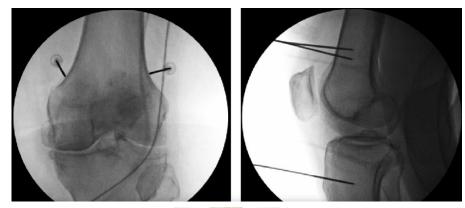

Genicular Nerve Denervation

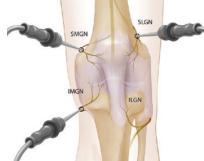

Safety and Efficacy of Genicular Nerve Radiofrequency Ablation for Management of Painful Total Knee Replacement: A Systematic Review

Naga Cheppalli 1 , Amit W. Bhandarkar 2 , Senthil Sambandham 3 , Solomon F. Oloyede 1

1. Orthopaedics, University of New Mexico School of Medicine, Albuquerque, USA 2. Orthopedics, SSM Health St Mary's Hospital, Centralia, USA 3. Orthopedics, University of Texas Southwestern Medical Center, Dallas, USA

 genicular nerve radiofrequency ablation can treat residual pain after TKR, with 50-55% improvement in pain up to 3 months with minimal complications

Peripheral Nerve Stimulation

Open Access

TECHNICAL NOTE

Ultrasound-guided percutaneous peripheral nerve stimulation for analgesia following total knee arthroplasty: a prospective

feasibility study

Brian M. Ilfeld^{1*}, Christopher A. Gilmore² Amorr Wongsampigoon⁸ and Joseph V Mini-Review of the Neuroanatomy and the Evidence from Clinical

Studies

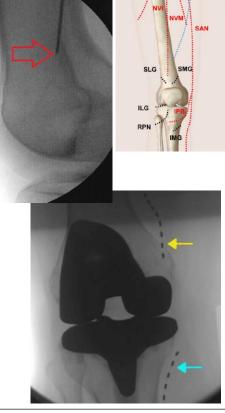

Chih-Peng Lin, MD, PhD,

Peripheral Stimulation of the Saphenous and Superior Lateral Genicular Nerves for Chronic Knee Pain

Jamal Hasoon¹, Wireless High-Frequency Peripheral Nerve Stimulation for Chronic Refractory Knee Pain Post-total Knee Replacement

Gaurav Chauhan 1 , Suresh K. Srinivasan 2 , Suchit Khanduja 3

 Peripheral nerve stimulation is likely to be a feasible and safe treatment for both knee OA and post-operative knee pain, however its effectiveness is still being explored.

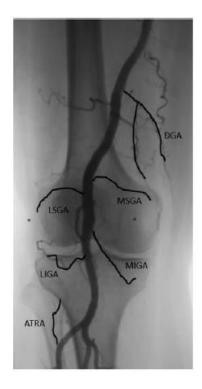

Ilfeld BM, et al. J Orthop Surg Res. 2017 Jan 13;12(1):4. | Lin CP, et al. Pain Med. 2020 Aug 1;21(Suppl 1):S56-S63. Hasoon J, et al. Cureus. 2021 Apr 29;13(4):e14753. | Chauhan G, et al. Cureus. 2023 Mar 4;15(3):e35759.

Genicular Artery Embolization for Primary Knee Osteoarthritis

Ravi Tyagi, $\rm BS^1~S.~Samaduddin~Ahmed,~BA^2~Yilun~Koethe,~MD^3~Aleksandr Raskind ,~BS^2~Osman~Ahmed,~MD^4$

- low-grade inflammation and neo-angiogenesis play a central role in knee osteoarthritis pain
- embolization of abnormal hyperemic genicular arteries can decrease synovial inflammation, neovascularization, and pain in affected areas

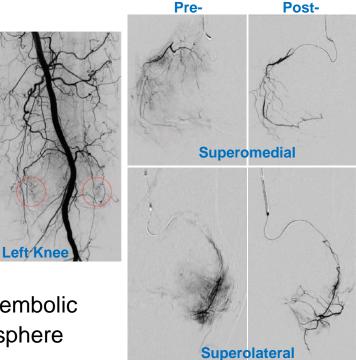

Genicular Artery Embolization for Primary Knee Osteoarthritis

Ravi Tyagi, $\rm BS^1~S.~Samaduddin~Ahmed,~BA^2~Yilun~Koethe,~MD^3~Aleksandr Raskind ,~BS^2~Osman~Ahmed,~MD^4$

- superficial femoral artery is catheterized
- abnormal arteries have a "tumor blush"
- selective embolization using a microcatheter suppresses filling ("blush") of abnormal arteries
- embolic agents vary: imipenem/cilastatin; polyvinyl embolic material (10-70µm); Embozene (75-100µm); Embosphere microspheres/ Optisphere (100-300µm); gelatin sponge particles (150-350µm)

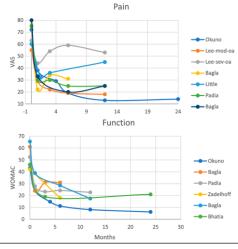

REVIEW ARTICLES

Genicular Artery Embolization for Knee Osteoarthritis A Comprehensive Review

😰 Poursalehian, Mohammad MD¹; 😰 Bhia, Iman MD¹; 😰 Ayati Firoozabadi, Mohammad MD¹; 🗊 Mortazavi, Seyed Mohammad Javad MD^{1,a}

- Outcomes
 - early (4 months) improvement in pain and function for mildmoderate OA
 - significant improvement of synovitis, but no change to joint pathology at 2 years
 - poorer outcomes with severe OA (~1 month), bone marrow lesions, meniscal injury
 - insufficient literature on outcome of TKA after GAE
 - GAE could be viable option on for treating post-TKA pain

Genicular artery embolization for treatment of knee osteoarthritis pain: Systematic review and meta-analysis

Bedros Taslakian ^{a,*}, Larry E. Miller ^b, Tarub S. Mabud ^a, William Macaulay ^c, Jonathan Samuels ^d, Mukundan Attur ^d, Erin F. Alaia ^e, Richard Kijowski ^e, Ryan Hickey ^a, Akhilesh K. Sista ^f

- Most studies have not reported severe complications to date
 - resolving focal skin ulcerations (3 days); tissue necrosis; bone infarction
 - plantar paresthesias; leg numbness; heat sensation
- Mild adverse effects
 - transient (3 weeks) skin discoloration with <100-µm particles; skin redness; purpura
 - resolving subcutaneous hemorrhages/ hematoma at access site
 - post-embolization syndrome: knee pain, low-grade fever, malaise

- Guidelines for nonsurgical management of knee osteoarthritis
- Therapeutic agents in nonsurgical interventions
- Ultrasound-guided injections
- Genicular nerve denervation
- Peripheral nerve stimulation
- Genicular artery embolization
